Probaho

Approval-gated cash-flow recovery for small businesses

FinTechathon 2026 · International Track · Topic E

DRAFT — replace team details before submission

The moment that matters

Payroll is approaching. Cash is short.

A small-business owner needs bounded choices, not another dashboard.

Probaho turns business records into a source-linked gap, compares recovery options, and keeps the human in control.

Shapla Services · synthetic scenario

Opening cash	BDT 120,000
Payroll	BDT 80,000
Supplier bill	BDT 70,000
Confirmed receivable	BDT 20,000
Reserve floor	BDT 20,000

Base closing cash: BDT -10,000

Reserve shortfall: BDT 30,000

From records to a decision

1. Validate transactions, invoices, and supplier bills
2. Project base, late-collection, and approved-recovery scenarios
3. Compare reminder, supplier reschedule, and labelled mock financing
4. Review payee, amount, dates, assumptions, and constraints
5. Approve one bounded action
6. Execute only in the synthetic sandbox and read the result back

The boundary is the product

The model can read and propose.

A human approves.

A synthetic supplier-consent event is separate.

The sandbox changes schedule state only.

No bank call. No lender decision. No real supplier message.

Reminders never count as collections. Mock financing never executes.

Security that a judge can inspect

- Business-scoped records and exports
- Integer-paisa deterministic calculations
- Plan + policy + snapshot hashes
- Expiry, nonce, payee, amount, date, and state checks
- Supplier-consent gate
- One-time idempotency receipt
- Post-commit read-back
- Independent per-business audit hash chain

A small, explicit agent

read_ledger

project_cash

compare_plans

create_reminder_draft

No approval tool. No execute tool. No arbitrary SQL, shell, HTTP, or payments.

Raw descriptions and counterparties are redacted before optional provider calls.

What we will measure

Deterministic calculation correctness

End-to-end task completion

Forbidden-action attempts

Retry and replay safety

Prompt-injection resistance

Latency and provider cost

3–5 consenting SME/domain reviewers

This draft reports no unmeasured user or live-model result.

Contribution and next step

Probaho is a complete, replayable financial-agent loop:

records → gap → bounded plan → human approval → sandbox receipt → evidence

Next: organizer confirmation, consenting SME validation, live-provider evaluation, final English deck, and recorded demo
